DETAILED ACTION

1. Claims 1-55 remained pending.

Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claims 1-55, are rejected under 35 U.S.C. 103(a) as being unpatentable over Dykstra et al (Hereinafter Dykstra U.S Patent No: 6, 029, 149) in view Freeman et al (Hereinafter Ramsey U.S Patent 6, 249, 775.

As per claims 1-14, Dykstra discloses an automated loan risk assessment system, comprising: means for receiving information about a loan; and means for the loan based on a plurality of risk factors including at least two of a fraud risk factor, an underwriting risk factor and a property valuation risk factor, whereby the risk score can be used by a loan service provider in deciding whether or not to fund or insure the loan.(Note abstract and see column 3 lines 32-67 and column 4-7 lines 1-67).

Dykstra fail to explicitly teach calculating a risk score for the loan.

Freeman discloses loan unit or instrument represents to the financial institution an opportunity to earn a profit on the differential between its cost of money and the amount of interest earned from the borrower. Another profit component is realizable from the servicing element of each loan entity. That is, a finite budget for labor and equipment use must be allocated when the loan is issued to service each loan over its life time. The banking trade has traditionally derived substantial revenues from the servicing of loan portfolios, to the extent that they were able to service loans at a cost below the originally calculated service allocation. Consequently, banks and other financial institutions sometimes trade loan "servicing" contracts. These contracts are routinely purchased and sold in large units since they represent income opportunities. For example, a bank which lacks a servicing department might contract with another bank to service its loans at a set, per loan pricing arrangement. The bank that purchases the contract does so with the expectation of earning a profit on the project. If it develops later that a particular loan portfolio experiences a large rate of defaults, the extra servicing needed to collect funds on the loans might render the particular servicing contract unprofitable. In such a situation, the service organization might attempt to resell the service contract to another service organization which might be interested in it, for example, at an increased service rate. (see column 13 lines 65-67 and column 14 lines 1-67 and column 20 lines 1-15).

Application/Control Number: 10/046,945

Art Unit: 3692

Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Dykstra to include calculating a risk score for the loan taught by Freeman in order to provide a system the ability of financial institutions managers to choose witch mortgage and other debt instrument application to underwrite.

As per claims 15-28, Dykstra discloses an automated loan risk assessment system, comprising:

a mechanism adapted to receive information about a loan; and a mechanism adapted to based on a plurality of risk factors including at least two of a fraud risk factor, an underwriting risk factor and a property valuation risk factor, whereby the risk score can be used by a loan service provider in deciding whether or not to fund or insure the loan. (Note abstract and see column 3 lines 32-67 and column 4-7 lines 1-67).

However Dykstra fail to explicitly teach calculating a risk score for the loan.

Freeman discloses loan unit or instrument represents to the financial institution an opportunity to earn a profit on the differential between its cost of money and the amount of interest earned from the borrower. Another profit component is realizable from the servicing element of each loan entity. That is, a finite budget for labor and equipment use must be allocated when the loan is issued to service each loan over its life time. The banking trade has traditionally derived substantial revenues from the servicing of loan portfolios, to the extent that they were able to service loans at a cost below the originally calculated service allocation. Consequently, banks and other financial institutions sometimes trade loan "servicing" contracts. These contracts are routinely purchased and sold in large units since they represent income opportunities. For example, a bank which lacks a servicing department might contract with another bank to service its loans at a set, per loan pricing arrangement. The bank that purchases the contract does so with the expectation of earning a profit on the project. If it develops later that a particular loan portfolio experiences a large rate of defaults, the extra servicing needed to collect funds on the loans might render the particular servicing contract unprofitable. In such a situation, the service organization might attempt to resell the service contract to another service organization which might be interested in it, for example, at an increased service rate. (see column 13 lines 65-67 and column 14 lines 1-67 and column 20 lines 1-15).

Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Dykstra to include calculating a risk score for the loan taught by Freeman in order to provide a system the ability of financial institutions managers to choose witch mortgage and other debt instrument application to underwrite.

Application/Control Number: 10/046,945

Art Unit: 3692

As per claims 29-42, Dykstra discloses a computer-readable medium whose contents cause a computer system to assess the risk associated with funding or insuring a loan by performing the steps of:

receiving information about a loan; and

based on a plurality of risk factors including at least

two of a fraud risk factor, a credit risk factor and a property valuation risk factor. (Note abstract and see column 3 lines 32-67 and column 4-7 lines 1-67).

Dykstra fail to explicitly teach calculating a risk score for the loan.

Freeman discloses loan unit or instrument represents to the financial institution an opportunity to earn a profit on the differential between its cost of money and the amount of interest earned from the borrower. Another profit component is realizable from the servicing element of each loan entity. That is, a finite budget for labor and equipment use must be allocated when the loan is issued to service each loan over its life time. The banking trade has traditionally derived substantial revenues from the servicing of loan portfolios, to the extent that they were able to service loans at a cost below the originally calculated service allocation. Consequently, banks and other financial institutions sometimes trade loan "servicing" contracts. These contracts are routinely purchased and sold in large units since they represent income opportunities. For example, a bank which lacks a servicing department might contract with another bank to service its loans at a set, per loan pricing arrangement. The bank that purchases the contract does so with the expectation of earning a profit on the project. If it develops later that a particular loan portfolio experiences a large rate of defaults, the extra servicing needed to collect funds on the loans might render the particular servicing contract unprofitable. In such a situation, the service organization might attempt to resell the service contract to another service organization which might be interested in it, for example, at an increased service rate. (see column 13 lines 65-67 and column 14 lines 1-67 and column 20 lines 1-15).

Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Dykstra to include calculating a risk score for the loan taught by Freeman in order to provide a system the ability of financial institutions managers to choose witch mortgage and other debt instrument application to underwrite.

As per claims 43-55, Dykstra discloses a computer-implemented method of assessing the risk associated with the funding or insuring of a loan, comprising: receiving information about a loan; and

based on a plurality of risk factors including at least two of a fraud risk factor, an underwriting risk factor and a property valuation risk factor. (Note abstract and see column 3 lines 32-67 and column 4-7 lines 1-67).

Application/Control Number: 10/046,945 Page 5

Art Unit: 3692

Dykstra fail to explicitly teach calculating a risk score for the loan.

Freeman discloses loan unit or instrument represents to the financial institution an opportunity to earn a profit on the differential between its cost of money and the amount of interest earned from the borrower. Another profit component is realizable from the servicing element of each loan entity. That is, a finite budget for labor and equipment use must be allocated when the loan is issued to service each loan over its life time. The banking trade has traditionally derived substantial revenues from the servicing of loan portfolios, to the extent that they were able to service loans at a cost below the originally calculated service allocation. Consequently, banks and other financial institutions sometimes trade loan "servicing" contracts. These contracts are routinely purchased and sold in large units since they represent income opportunities. For example, a bank which lacks a servicing department might contract with another bank to service its loans at a set, per loan pricing arrangement. The bank that purchases the contract does so with the expectation of earning a profit on the project. If it develops later that a particular loan portfolio experiences a large rate of defaults, the extra servicing needed to collect funds on the loans might render the particular servicing contract unprofitable. In such a situation, the service organization might attempt to resell the service contract to another service organization which might be interested in it, for example, at an increased service rate. (see column 13 lines 65-67 and column 14 lines 1-67 and column 20 lines 1-15).

Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Dykstra to include calculating a risk score for the loan taught by Freeman in order to provide a system the ability of financial institutions managers to choose witch mortgage and other debt instrument application to underwrite.

Conclusion

RESPONSE TO ARGUMENTS

4. Applicant's arguments filed 5/4/2007 has been fully considered but they are moot in view of new grounds of rejections.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Clement B Graham whose telephone number is 571-272-6795. The examiner can normally be reached on 7am to 5pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Hyung S. Sough can be reached on 703-308-0505. The fax phone numbers for the organization where this application or proceeding is assigned are 703-305-0040 for regular communications and 703-305-0040 for After Final communications.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is 703-305-3900.
